

Lockout

Introduction

The "Lockout" training course was developed by a team of professionals who wanted to improve efficiency measures and respect for occupational health and safety standards. This 60-minute training course can be taken at any time.

Description

Many serious accidents occur in the workplace. These accidents are often the result of a part of the body coming into contact with high-voltage parts, moving mechanical parts or chemical products or hazardous high-pressure fluids that have accidentally leaked. It is inconceivable to think that merely turning off equipment is enough when performing work in a hazardous area. Lockout is a protective method that helps eliminate the risks of accidents by neutralizing the energy sources that could restart the equipment on which work is being carried out.

Target Population

This training course is intended for all regular and casual workers as well as for all corporate executives.

Prerequisites

There is no prerequisite for this training course. No other training or experience is required to take this training.
